

MsgViewer Pro™

The advanced viewer and converter for email content

What is MsgViewer Pro?

MsgViewer Pro is a flexible, easy to use tool for managing .msg and .eml (mime) email files. It is used by businesses large and small in a variety of applications, from allowing users access to legacy email, to easing transitions between email clients, naming and converting email for legal discovery, converting email from the command line, providing access to email in a shared environment, and more.

With MsgViewer Pro, you can easily view your email messages, reply or forward email using your regular email client, convert email to PDF, text or other image formats, batch extract file attachments, search your message cache for important messages, and more.

MsgViewer Pro's interface can be customized by command line settings, allowing for removal of any undesired product features.

Manages emails in recursive directories

By clicking a simple check box called "Read Subfolders," MsgViewer Pro will automatically search subdirectories, and display any .msg or .eml files that it finds. Uncheck the box if you only want to display files residing in the selected folder. Even if your emails are organized in multiple folders, this powerful feature allows you to search multiple folders without having to select each folder separately.

Export to Image Functionality, and other powerful features

MsgViewer Pro makes it easy to batch export your .msg or .eml files directly to these formats: PDF, JPG, GIF, TIF, PNG, BMP, TXT or CSV (ansi or Unicode).

You can choose to automatically extract file attachments from a single message, or from many messages as a batch.

Automatically rename messages (or exported messages) using a flexible "Bates Stamp" like naming system.
