MessageExport™

The advanced email export utility for Microsoft® Outlook®

What is MessageExport?

MessageExport is exactly what Microsoft® should have included in Outlook in the first place: an integrated tool to export, format, convert, and copy your email messages.
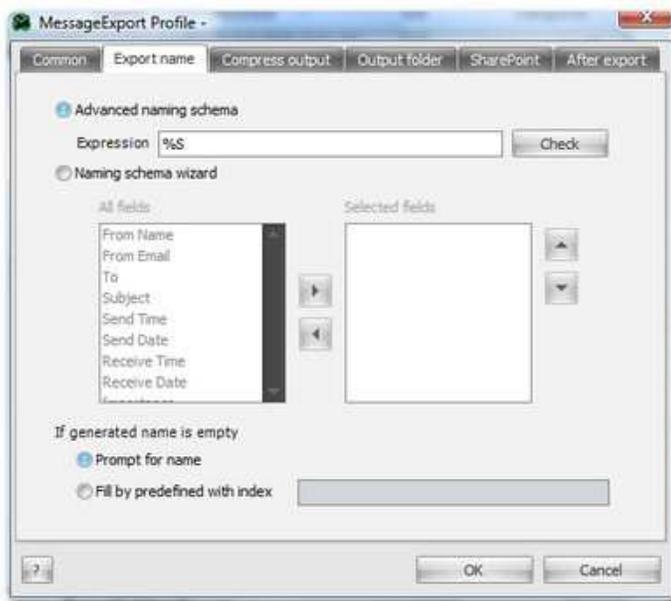

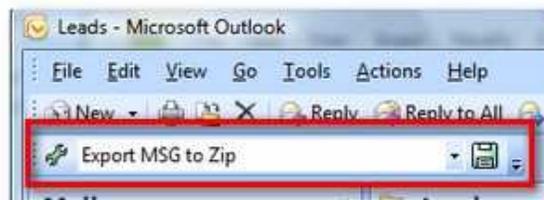

Although MessageExport performs many functions right out of the box, its capabilities may be expanded by creating custom "export profiles" that can accomplish many different tasks, saving you time.

Use MessageExport to:

o   Backup or export your Outlook email folders, including folder structures
o   Convert one or thousands of emails to PDF, Text, HTML, MHT, CSV and other formats, with drag and drop simplicity
o   Copy messages to MBOX format for storage or transfer
o   File your messages to a local, network or Sharepoint library.
o   Logically name your exported files by combining criteria, such as date, from email, subject, and much more
o   Extract email attachments in bulk
o   Bulk printing and conversion
o   Remove files, or run an application after export

Supported Conversion Formats:

o   MSG
o   EML
o   PDF
o   HTML
o   MHT
o   MBOX
o   GIF
o   TIG
o   PNG
o   TXT
o   CSV

Supports Symantec® Enterprise Vault® and Microsoft® Sharepoint®.

Supports Custom Profiles

For example, you can configure a profile to include a folder location, naming and formatting preferences. You can give any name to an export profile, such as project name, or short description of its function. For example, a profile that converts email to PDF files, applies a file name based on the received date, and compresses them all into a zip file could be called, "Export PDF to Zip by date."
